ncdfFlow: Provides netCDF storage based methods and functions for manipulation of flow cytometry data

Mike Jiang, Greg Finak, N. Gopalakrishnan October 30, 2017

Abstract

Background The Bioconductor package flowCore is the object model and a collection of standard tools designed for flow cytometry data analysis. The related R packages including data analysis (flowClust, flowMerge, flowMeans,flowTrans,flowStats), visualization (flowViz) and quality control (flowQ) use the flowCore infrastructure to deal with flow cytometry data. However the flowFrame or flowSet which represent a single or a set of FCS files are memory-resident data structures and require the entire data elements to remain in memory in order to perform all kinds of the data manipulations. Hundreds or thousands of datasets generated by high throughput instruments can easily hit the memory limit if they are imported as the flowSet or flowFrames in R. It presents a challenge to scientists and bioinformaticians who use the R tools described above to perform statistical data analysis on a regular computer. We propose a new R object model and related functions to address this problem. The new model ncdfFlowSet inherit most of data structures from flowSet. It stores the large volume of event-level data on disk and only keeps the file handler and meta data in memory. Thus the memory consumption is significantly reduced. NetCDF is used as the data formats because it is self-describing, machine-independent and specifically optimized for storing and accessing array-oriented scientific data. With the compression and chunking features introduced by the new release of netCDF4, the new model is able to maintain high performance of data processing.

Most of the functions and methods including transformation, compensation, gating and subsetting methods for flowSet are extended to ncdfFlowSet (spillover, normalize and workflow methods of flowCore are currently not supported yet.). Thus the change of data structure is almost transparent to the users of flowCore-based R packages. keywords Flow cytometry, high throughput, netCDF, flowSet, ncdfFlowSet

1 Representing Flow Cytometry Data with ncdfFlowSet

ncdfFlow reppresents a flow cytometry data model that is very similar to the flowSet structure. The only difference is that the event-based 2-D data matrices from multiple samples of the same experiment are stored as one single 3D data matrix on disk in ncdf format. Each sample can be accessed efficiently from the 3-D matrix as a data chunk or slice and further manipulated in memory.

The basic unit of manipulation in ncdfFlow is the ncdfFlowSet. It inherites all the slots from flowSet. However, the flowFrame objects stored in the "frames" slot of a ncdfFlowSet object do not host the data matrix.Instead, their the "exprs" lots are kepted empty and the

actual data are stored in the 3-D data matrix on disk and only the file name is stored in "file" slot of ncdfFlowSet. Thus ncdfFlowSet reduces the memory requirements and meanwhile ensures the consistent data structure with flowSet.

2 Creating a ncdfFlowSet

We provide a function to read FCS files into a ncdfFlowSet object:

```
> path<-system.file("extdata","compdata","data",package="flowCore")
> files<-list.files(path,full.names=TRUE)[1:3]
> nc1 <- read.ncdfFlowSet(files=files)
> nc1

An ncdfFlowSet with 3 samples.
NCDF file : /tmp/Rtmpe4lw6T/ncfs659f2f9df7fd.nc
An object of class 'AnnotatedDataFrame'
  rowNames: 060909.001 060909.002 060909.003
  varLabels: name
  varMetadata: labelDescription

column names:
  FSC-H, SSC-H, FL1-H, FL2-H, FL3-H, FL1-A, FL4-H
```

As we see, the contructor function is very similar to the *flowSet* execpt that it requires a filename for the ncdf file.

```
> fs1 <- read.flowSet(files=files)</pre>
```

Note that an ncdf file that stores the actual data is generated and saved on disk once a ncdfFlowSet is created. Users need to explicitly call the unlink method to remove the file before delete the object from memory by rm.

```
> unlink(nc1)
> rm(nc1)
```

Users can also create an empty ncdfFlowSet first and add data slices later by assigning argument isWriteSlice as FALSE.

```
$P4 FL2-H
               <NA> 1024
                              -111
                                        1023
$P5 FL3-H
               <NA> 1024
                              -111
                                        1023
                              -111
$P6 FL1-A
               <NA> 1024
                                        1023
$P7 FL4-H
               <NA> 1024
                                        1023
                              -111
```

1 keywords are stored in the 'description' slot

As we see here, before writing the actual flowFrame by [[<-, the flowFrame object returned by [[has 0 events.

- > targetSampleName<-sampleNames(fs1)[1]
- > nc1[[targetSampleName]] <- fs1[[1]]</pre>
- > nc1[[1]]

flowFrame object '060909.001'

with 10000 cells and 7 observables:

	name	desc	range	${\tt minRange}$	maxRange	
\$P1	FSC-H	FSC-Height	1024	0	1023	
\$P2	SSC-H	SSC-Height	1024	0	1023

\$P7	FL4-H	<na></na>	1024	-111	1023

1 keywords are stored in the 'description' slot

Note that it is important to always use sample name to specify the target position in the data matrix where the actual is added. Because the sample name is the identifier used to index the data matrix.

Sometime it is helpful to copy the structure from an existing ncdfFlow object and then add the data slice to the empty ncdfFlow cloned by clone.ncdfFlowSet.

```
> nc2 <- clone.ncdfFlowSet(nc1, isEmpty = TRUE)
> nc2[[1]]
```

```
> nc2[[sampleNames(fs1)[1]]] <- fs1[[1]]
> nc2[[1]]
```

We also provide the coerce function to convert the flowSet to a ncdfFlowSet.

```
> data(GvHD)
> GvHD <- GvHD[pData(GvHD)$Patient %in% 6:7][1:4]
> nc1<-ncdfFlowSet(GvHD)
Or coerce a ncdfFlowSet to flowSet</pre>
```

> fs1<-as.flowSet(nc1,top=2)

Note that ncdfFlowSet is designed to store large datasets and it is not recommend to corece the entire ncdfFlowSet to flowSet. Usually users want to select a subset from ncdfFlowSet by [and convert the subetted data. Sometimes it is helpful to randomly select a cerntain number of flowFrames from the entire datasets represented by by ncdfFlowSet to have a preview of the data. The arugment "top" can be used here for this purpose.

3 Working with metadata

Like flowSet,ncdfFlowSet has an associated AnnotatedDataFrame that provides metadata of experiments. This data frame is accessed and modified via the same methods of flowCore. :

```
> phenoData(nc1)
> pData(nc1)
> varLabels(nc1)
> varMetadata(nc1)
> sampleNames(nc1)
> keyword(nc1,"FILENAME")
> identifier(nc1)
> colnames(nc1)
> colnames(nc1,prefix="s6a01")
> length(nc1)
> getIndices(nc1,"s6a01")
```

4 Manipulating a ncdfFlowSet

You can extract a *flowFrame* from a *ncdfFlowSet* object in the same way as *flowSet* by using the [[or \$ extraction operators. Note that using the [extraction operator returns a new *ncdfFlowSet* that points to the same ncdf file. SO the original ncdf file serves as a data repository and the ncdfFlowSet works as view of the data in this sense.

```
> nm<-sampleNames(nc1)[1]
> expr1<-paste("nc1$'",nm,"'",sep="")
> eval(parse(text=expr1))
```

flowFrame object 's6a01'

with 2205 cells and 8 observables:

flowSet-specific iterator fsApply can also be applied to RobjectncdfFlowSet:

```
> fsApply(nc1,range)
```

However, we recmmend to use another iterator ncfsApply designed for the function that returns a flowFrame (such as compensate,transform...). ncfsApply works the same as fsApply execpt that it returns a ncdfFlowSet object with the acutal data stored in cdf to avoid the huge memory consumption. Note that the return value of the function applied in ncfsApply must be a flowFrame object and it should have the same dimensions(channles and events) as the original data.

5 Compensation, Transformation and Gating

transform amd compensate for ncdfFlowSet work the same as flowSet.

```
> cfile <- system.file("extdata","compdata","compmatrix", package="flowCore")
> comp.mat <- read.table(cfile, header=TRUE, skip=2, check.names = FALSE)
> comp <- compensation(comp.mat)
> #compensation
> summary(nc1)[[1]]
> nc2<-compensate(nc1, comp)
> summary(nc2)[[1]]
> unlink(nc2)
> rm(nc2)
> #transformation
> asinhTrans <- arcsinhTransform(transformationId="ln-transformation", a=1, b=1, c=1)
> nc2 <- transform(nc1, `FL1-H`=asinhTrans(`FL1-H`))</pre>
```

> fsApply(nc1, each_col, median)

```
> summary(nc1)[[1]]
```

- > unlink(nc2)
- > rm(nc2)

Note that compensation/transformation return the ncdfFlowSet objects that point to the new cdf file containing the compensated/transformed data.

filter for flowSet also works for ncdfFlowSet:

```
> rectGate <- rectangleGate(filterId="nonDebris", "FSC-H"=c(200,Inf))
> fr <- filter(nc1,rectGate)
> summary(fr)
> rg2 <- rectangleGate(filterId="nonDebris", "FSC-H"=c(300,Inf))
> rg3 <- rectangleGate(filterId="nonDebris", "FSC-H"=c(400,Inf))
> flist <- list(rectGate, rg2, rg3)
> names(flist) <- sampleNames(nc1[1:3])
> fr3 <- filter(nc1[1:3], flist)
> summary(fr3[[3]])
```

6 Subsetting

Min.

200.0000

0.0000

The Subset and split methods for *ncdfFlowSet*:

```
> nc2 <- Subset(nc1,rectGate)</pre>
> summary(nc2[[1]])
             FSC-H
                       SSC-H
                                                FL2-H
                                                                       FL2-A
                                    FL1-H
                                                            FL3-H

Note that Subset does not create the new ncdf file (the same as extraction operator [). So we need to be careful about using unlink to delete the subsetted data since it points to the same ncdf file that is also used by the original ncdfFlowSet object.

split returns a ncdfFlowList object which is a container of multiple ncdfFlowSet objects.

```
> ##splitting by a gate
> qGate <- quadGate(filterId="qg", "FSC-H"=200, "SSC-H"=400)</pre>
> fr<-filter(nc1,qGate)
> ncList<-split(nc1,fr)</pre>
> ncList

Note that the ncdfFlowSet objects contained in ncdfFlowList by default share the same ncdf file as the original ncdfFlowSet. In order to keep its own data copy, try to set argument isNew to "TRUE" in split method.

> ncList_new<-split(nc1,fr,isNew=TRUE)</pre>
